Introduction

Methodology

Overall Findings From Food Animal Student Career Selection Survey

Respondent Demographic and Animal Experience Profile

Career Area Decision Factors

Encouraging Food Animal Careers

Career expectations for Food Animal Veterinarians
Introduction

The purpose of this survey is to understand, from those 3rd and 4th year veterinary students interested in food animal medicine careers, (1) the factors that influenced their career selection decisions, (2) strategies they believe would encourage more students to enter into food animal careers, and (3) their expectations of a career in food animal medicine. This is an important group to consider as they have committed themselves to a food animal career. Understanding the motivations of this group will allow strategies to be developed that may encourage other students to enter into FSVM related fields.
Methodology

Sample

The Deans at all 32 colleges of veterinary medicine in the United States and Canada were contacted and asked to participate in the survey by supplying email contact information for their third and fourth year veterinary students. Tremendous support was received with 19 colleges providing email listings directly to us and another 13 colleges agreeing to send out the survey directly to their students. The survey was administered in April of 2005. Three waves of a pretested questionnaire were sent out in one week increments. The survey was sent to 1,657 valid email addresses with 713 students responding (270 with a food animal focus), resulting in a 43% response rate. The findings reported in this chapter are focused on the 270 food animal students. Responses were received from students at all 32 colleges of veterinary medicine in the United States and Canada. The questionnaire was approved by the FSVMC and AAVMC.
Methodology (continued)

Cover letter / Survey / Constructs

Third and fourth year veterinary students were sent an email message from the research team that explained the purpose of the research, identified the sponsoring organizations, and invited them to participate in the study. A web URL was included in the email message that linked to the online survey. The survey was pretested and sent out in three waves separated by one week increments in order to increase response rates. A variety of questions were asked in this research instrument including planned occupational area, past experience with animals, multiple career decision influences, strategies for encouraging students to enter food animal careers, expectations of food animal careers, and level of career knowledge.
Non-response Bias

Statistical analyses were carried out for non-response bias. A wave analysis with the Student’s t-test was used to look for differences between early and late returns. This provides some information about whether the data from completed questionnaires are biased by the likelihood of non-response. The wave analysis method assumes that subjects who respond less readily are more like non-respondents. Using the t-test for two sample proportions and a 95 per cent level of confidence, it was found that there were no significant differences between early and late returns for items in the questionnaire at the 0.05 level. Since the study did not involve sensitive issues, it was concluded that there was no compelling reason to believe that the response group systematically possessed different response tendencies from non-responders.
Overall Findings from Food Animal Student Career Selection Survey

• While these 3rd and 4th year food animal focused students primarily come from rural backgrounds, many would like to live in suburban and larger cities following graduation. While, there is still a sizeable group who prefer to live in a small city or rural area, 75% of these students planning to spend at least one-third of their time working with food animals do not desire a career that will let them lead a rural lifestyle.

• While large percentages of these 3rd and 4th year food animal focused students report significant experience working with food animals prior to veterinary college (71%), having a good role model in food animal production (56%), having worked for a food animal veterinarian prior to veterinary college (48%), and having a food animal externship during veterinary college (67%), they still report a lack of knowledge about veterinary career opportunities in the food animal industry and a desire to learn more about industry careers. In addition, there is a sizeable portion that feel that their veterinary education has not adequately prepared them to work in a food animal practice. Further, many report being intimidated by the size of many food animals, but not concerned about injury or the physicality of the work.
Estimating FSVM Demand and Maintaining the Availability of Veterinarians for Careers in Food Supply Related Disciplines in the United States and Canada

Overall Findings from Food Animal Student Career Selection Survey (continued)

• These 3rd and 4th year food animal focused students are particularly interested in careers that will have great personal meaning to them and will allow them to contribute to their communities.

• They also seek careers that will allow them ample time to spend with their families. Although willing to work hard (41% expect to work 60 or more hours per week as a full time food animal veterinarian) they report a desire to avoid jobs that require on-call, night, and weekend hours. However, there is a high level of expectation that food animal veterinarians spend a lot of time on-call.

• These students have very positive attitudes toward food animal medicine. The vast majority believe that food animal veterinarians derive a great deal of job satisfaction from their careers, that food animal careers are stable, and that they can make a good annual salary in the profession.
Overall Findings from Food Animal Student Career Selection Survey (continued)

In terms of tactics that might be employed by veterinary medical schools or professional associations to encourage more students to consider food animal careers, the top ten tactics as rated by 3rd and 4th year food animal focused students are:

1. Assistance in setting up a food animal practice.
2. Add new faculty positions in food animal medicine.
3. Provide job placement services for careers in public health.
4. Making students select a curriculum track that provides detailed knowledge in particular areas of emphasis.
5. Provide high school and undergraduate college students written information about different food animal careers.
6. Payoff all student loans in exchange for working in a food animal veterinary medicine field for 3 years.
7. Financial assistance in purchasing equipment to begin a food animal practice.
8. Assigning students interested in food animal careers to a faculty mentor.
9. A first semester program in veterinary medical school that lets students study and treat food animals.
10. Establishment of mentoring / shadowing program that matches high school students with food animal veterinarians.
Respondent Demographic and Animal Experience Profile

Among all third and fourth year veterinary student respondents with a food animal focus

- Respondents primarily came from rural areas, farms, and ranches (49%). In terms of an ideal place to live, suburban areas were the first choice accounting for 22% of all responses. Small cities and rural areas combined to account for another 29% of responses.

- 71% of the respondents were female with most falling in the 25 to 29 age range. Most respondents had never been married (64%) with 36% reporting being married or cohabitating. 98% are Caucasian.

- While most respondents report having significant food animal experiences prior to veterinary school, fewer than half had worked for a food animal veterinarian prior to entering veterinary school and most (72%) did not feel that they had a great deal of knowledge about veterinary career opportunities in the food animal industry. Interestingly, over 70% felt that the specific area of veterinary medicine that they are currently focusing on came about by chance.

- The majority of respondents expected a salary in the range of 40,000 to 59,000 in their first job, growing to a range of 60,000 to 79,000 after 5 years.
Respondent Gender

Among all third and fourth year veterinary student respondents with a food animal focus

Q103: What is your gender?

Female: 70%
Male: 30%

Expected Starting Salary of a Food Animal Veterinarian

Among all third and fourth year veterinary student respondents with a food animal focus

Q76. The expected starting salary for a full time food animal veterinarian

- $60,000 to $79,000
- $40,000 to $59,000
- Less than $40,000
Expected Salary of a Food Animal Veterinarian Five Years out of School

Among all third and fourth year veterinary student respondents with a food animal focus

Q77. The expected salary for a full time food animal veterinarian 5 years out of school

- $120,000 or more
- $100,000 to $119,000
- $80,000 to $99,000
- $60,000 to $79,000
- $40,000 to $59,000
Expected Number of Hours Worked per Week for a Full-time Food Animal Veterinarian

Among all third and fourth year veterinary student respondents with a food animal focus

Q78. The expected average number of hours worked per week for a full time food animal veterinarian
Career Decision Factors Summary

The following career factors received a high level of agreement among respondents:

• They seek a meaningful job that will allow them to be a community leader and to work in group practices.
• They desire a veterinary occupation that minimizes their on-call, night, and weekend hours so that they can spend more time with family.
• They believe that a food animal medicine career will offer them a stable career with a good annual salary and will allow them to fully utilize their medical knowledge.
• They report being intimidated by the size of many food animals, but not concerned about being injured by the animals nor worried about the physical nature of the work.
• Counter to some other findings, these respondents are generally in favor of treating all sick animals no matter what the cost and most do not desire a career that will let them live a rural lifestyle.
Career Decision Factors

Summary of Strategies for Encouraging Food Animal Careers

Among all third and fourth year veterinary student respondents with a food animal focus

- Top tactics for encouraging students to enter food animal careers deal with either assistance in starting a career / finding a position or providing students more detailed knowledge of the area.

- Number one tactic is to provide assistance in setting up a food animal practice.

- Other top rated tactics for encouraging more students to enter food animal medical careers include adding new faculty positions in food animal medicine, providing job placement services for careers in public health, making students select a curriculum track that provides detailed knowledge in particular areas of food animal emphasis, and providing high school and undergraduate college students written information about different food animal careers.

Summary of Career Expectations for Food Animal Veterinarians

• Responses to the career expectation questions exhibit a relatively low level of agreement among respondents. That is, there are wide ranging opinions about these career expectations among respondents. This may be due to respondents having different career areas within food animal medicine in mind when they responded to the items. This suggests that there are careers within the food animal medicine area that are typical of all of these expectations, but also many that are not. As such, students selecting food animal careers may be able to select occupations that emphasize the factors that are important to them while minimizing other less desirable factors.

• Despite the variation in response to these career expectation questions, there are three expectations of food animal careers that were largely agreed on by respondents:
  – Food animal veterinarians spend a lot of time on-call
  – Food animal veterinarians get to interact with many people
  – Food animal veterinarians have a great deal of job satisfaction in their careers
